Sequence 3, Application US/08581918A
Patent No. 6043030
GENERAL INFORMATION:
APPLICANT: Beach, David H.
APPLICANT: Benetrick, Douglas J.
APPLICANT: Benetrick, Manuel
APPLICANT: Applicant, Gregory J.
TITLE OF INVENTION: Cell-Cycle Regulatory Proteins, and Uses
TITLE OF INVENTION: Related Thereto
NUMBER OF SEQUENCES: 39
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       116 lAspLeuAlaGluGluArgGlyHisArgAspValAlaGlyTyrLeuArgT 133

/note-"Organ: colon, vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site-1: Not I: Site-2: Eco RI; Plasmid DNA from the normalized library NCI_CGAP_COIO was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer. In a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (clonelDs 1057416-1061255, and 1144584-1145351).

Subtraction by Bento Soares and M. Fatima Bonaldo. " a 220 c 219 g 179 t lothers

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made iform the same library (cloneIDs 1257096-1258631, 1459064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Ratima Bonaldo.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. 1 others

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New cell cycle regulating proteins bind to cyclin dependent kinase and related nucleic acids, antibodies etc., used in diagnosis and therapy of abnormal cell proliferation, degeneration etc.

Example 4: Page 80; 109pp: Bnglish.

CDNA (T02965) coding for the mouse cell-cycle regulatory (CCR) protein plis (R82120) was isolated from an embryonal stem cell library using a probe based on human CCR pl6 cDNA (T02962).

The isolated CDNA can be used: to detect mutations in CCR genes that lead to cell proliferation; to breed transgenic annimals to study cellular disorders involving CCR allele mutation/misexpression; and to correct CCR-deficient cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 GGAGTACAGCAGCGGGAGCATGGTCGAGGTTCTTGGTCACTGTAAGGATTCAGCGCGC

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

Claim 2; Fig 1: 49pp; English.

A murine cDNA molecule (162485) homologous to human INK4A beta

I ranscripts (see also 762486) was isolated from a mouse

transcripts (see also T62486) was isolated from a mouse

crythroleukaemia cell DNA library. Sequences of exon 1-beta are

spliced to exon 2 to create an open reading frame that encodes a

novel protein, ARP-19 (W1631), which induces cell cycle arrest
when overexpressed. Unrelated sequences from exon 1-alpha (not
shown) are spliced to the same exon 2 acceptor site to open another

reading frame that encodes INK41a-p16 (C-terminal fragment given in
W1632), an inhibitor of the cyclin D-dependent kinases CDK4 and

CDK6. Economical reutilisation of protein codding sequences in this
manner is without precedent in mammalian genomes and the unitary
inheritance of INK4a-p16 and ARF-p19 may reflect a dual requirement

Cor both proteins in cell cycle control. ARF-p19 nucleic acids can

be used as probes or primers, or in gene therapy protocols to

induce cell arrest in eukaryotes or (antisense) to inhibit ARF-p19

cancer. Human ARF-p19 cDNA (165486) has also been isolated.

DNA specific for Multiple Tumour Suppressor IEI-beta gene - are useful for the diagnosis of cancers related to MTSIEI-beta useful for the diagnosis of cancers related to MTSIEI-beta mutation(s) and their treatment.

The useful for the diagnosis of cancers related to MTSIEI-beta mutation(s) and their treatment.

Sischosure: Figure 14; 72pp; English.

This is a mouse pi6 cDNA sequence used in the characterisation of the numan multiple tumour suppression proteins. MTSI, MST2 and MTSIEI-beta.

The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, company and produced in the diagnosis of predisposition to cancers, Hyppoma, CLL, and cancers of the pancreas, breast, thyroid, covary, uterus, testis, kidney, stomach and rectum.

Mouse multiple tumour suppressor 1 gene (MTS1) coding sequence.
Murine; multiple tumour suppressor 1 gene; MTS1; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; Fig 18; 80pp; English.

The present sequence encodes mouse multiple tumour suppressor (MTS1) gene. The MTS1 gene can be used to design primers to detect abnormalities 1.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of a nucleic acid used in the michacure;

This is the nucleotide sequence of a nucleic acid used in the method of the invention involving the used of the multiple tumour suppressor (WTS) gene to diagnose and treat human cancers. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. can by standard nucleic hybridisation techniques, of patient samples.

The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy contractions to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used to screen for drugs to be used for ancer therapy, and the protein citself may also be used to rescombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS function in a cell. ```
The present sequence encodes murine multiple tumour suppressor IEI-beta (MTSIEI-beta) protein. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 8; Fig 12A-B; 80pp; English.

Example 8; Fig 12A-B; 80pp; English.

The present sequence encodes a human multiple tumour suppressor IEI-beta fund The present protein. Primers designed from the gene can be used to design primers to detect abnormalities 1.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, Imphoma, gilona, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting polymorphism associated with cancer precidisposition - also DNA, vectors and host cells e.g. for gene or protein replacement therapy and drug screening
Example 7; Pages 100-10; 148pp; English.

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTSIIbeta gene ORF T00744 (which encodes R81700); The above assay can also be used in the diagnosis and prognessis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid cancers, etc. sequence 1131 BP; 232 A; 327 C; 343 G; 229 T;

The CDNA sequences encoding several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced. This sequence encodes the MTS polypeptide MTSIE1-bera (R80947). MTS polypeptide-encoding CDNAs and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS CDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also screening for potential cancer therapeutics.

Claim 1: Fig 12; 72pp; English.

Claim 1: Fig 12; 72pp; English.

MTSIEI-beta. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus is also referred to step familial melanoma in MTS genes can be used in the diagnosis of predisposition to concers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, LiL, and cancers of the pancreas, breast, thyrold, ovary, uterus, testis, kidney, stomach and rectum.

This is the nuclearies equence of the multiple tumour suppressor (MTSIEIS) gene, used in the method of the invention. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein stell may also be used to restore MTS function in a cell. Claim 2; Fig 7; 49pp; English.

Claim 2; Fig 7; 49pp; English.

A human CDN molecule (T62486) corresponds to INK4A beta

transcripts and includes a reading frame coding for a novel protein

(W16323), designated ARF-p19, which induces cell cycle arrest when

coverexpressed. This reading frame asyntactically overlaps a second

reading frame that encodes INK4a-p16 (C-terminal region given in

W16324), an inhibitor of the cyclin D-dependent kinases CDK4 and

CDK6. Economical reutilisation of protein coding sequences in this

manner is without precedent in mammalian genomes and the unitary

inheritance of INK4a-p16 enammalian genomes and the unitary

choth proteins in cell cycle control. ARF-p19 nucleic acids can

be used as probes or primers, esp. for cancer diagnosis, or in gene

therapy protocols to induce cell arrest in eukaryotes or (antisense)

co inhibit ARF-p19 acidutty, and to create transgenic animals useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 7: Fig 18; 80pp; English.

The present sequence encodes mouse multiple tumour suppressor (MTS2) gene. The MTS1 gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTSI gene ORF T00736 (which encodes R81701) mutant sequences T00749/50. The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid
